

ADVANCE BIPRO³

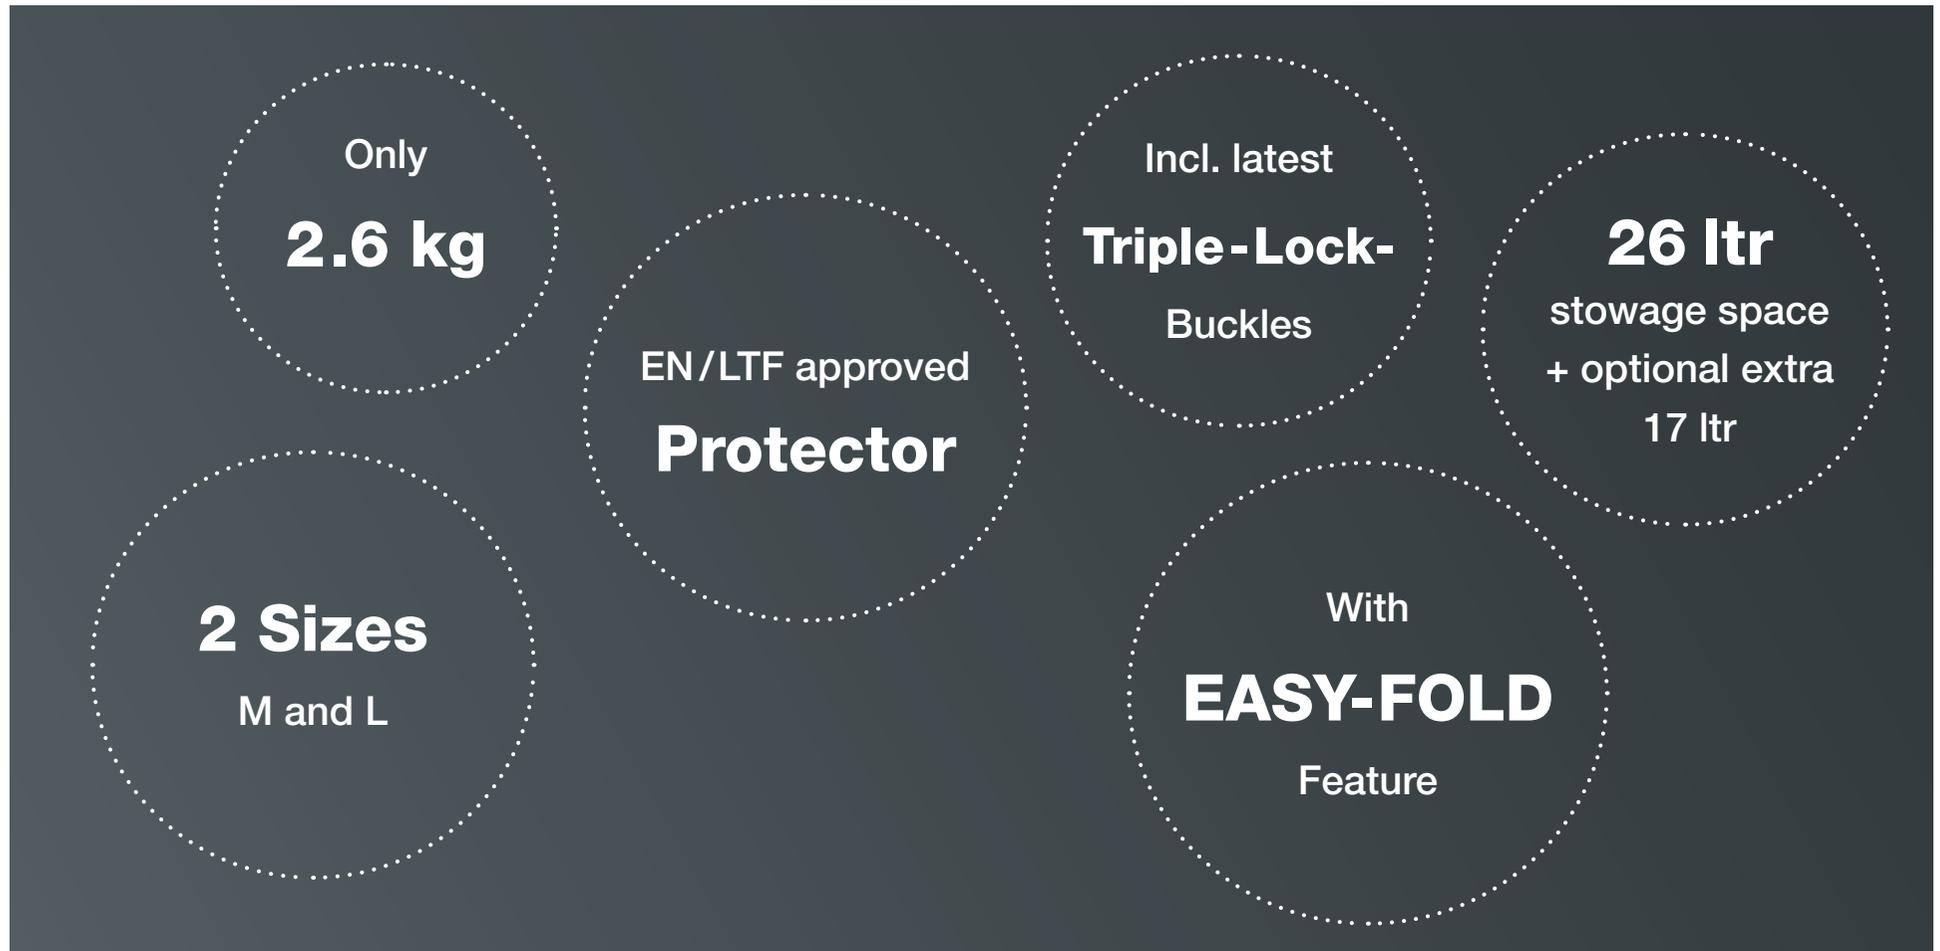

Product presentation

BIPRO 3 – Daily Ease

The BIPRO 3 tandem pilot harness has many useful features for a simple and safe working day. The harness weighs a mere 2.6 kg and is strongly built. It was developed at the world-famous Interlaken Tandem Hotspot in close and detailed cooperation with its professional tandem pilots. The BIPRO 3 fits comfortably into the ADVANCE All Tandem Series, and perfectly adapts to all its components. This exceptionally comfortable pilot harness will not only appeal to the daily professional, but will also serve the leisure tandem pilot perfectly.

Most important features at a glance

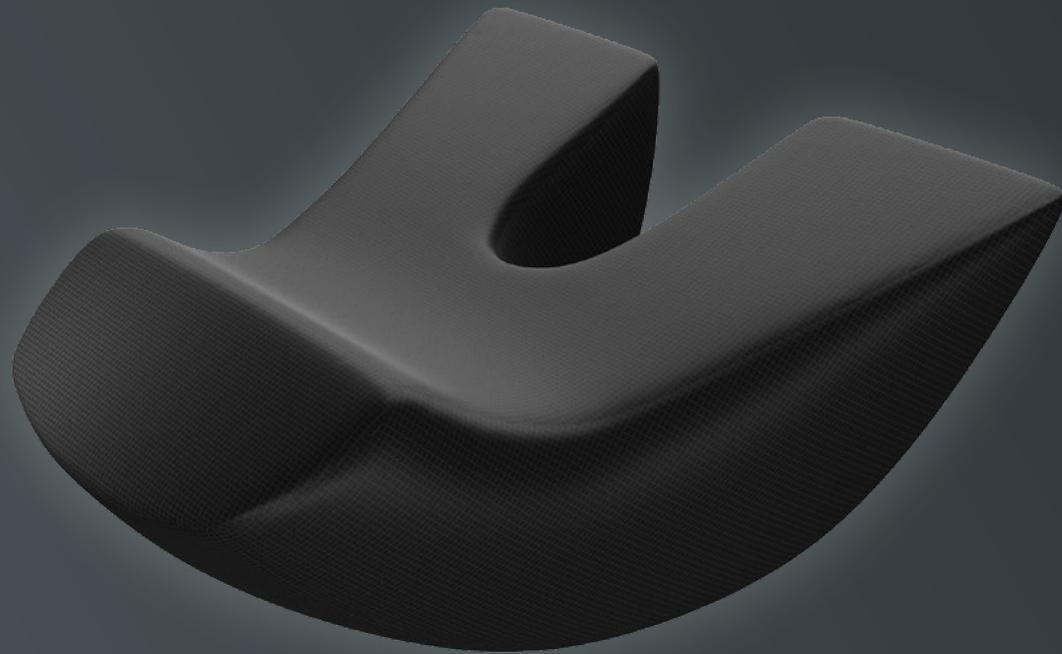

Comfortable V-Legpads

The V-shaped, well-padded legpads provide a comfortable sitting position behind the passenger, and avoid the pilot's knees pressing into the passenger's back: maximum comfort all round. A 3D-developed and well supported seat structure contributes to the high level of comfort.

Maximum Protection

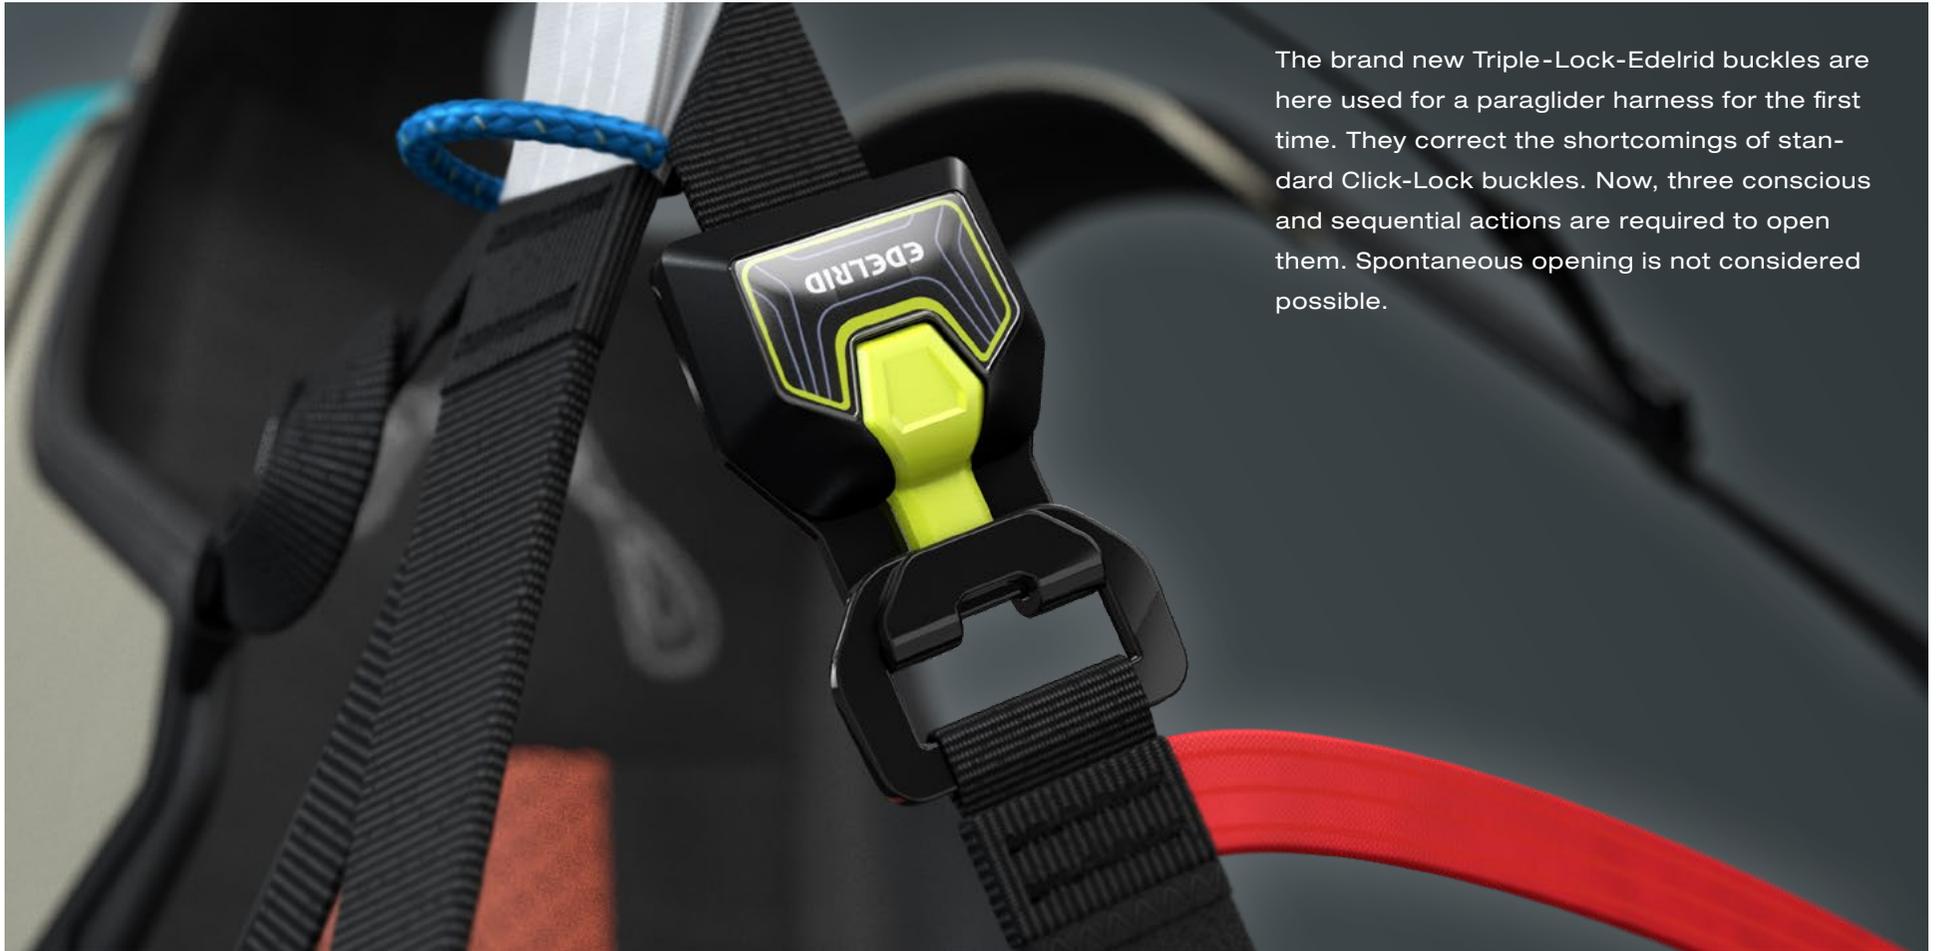

The ergonomic multi-chamber foam protector is EN/LTF approved. It fits around the legpads, but can easily be taken out of its compartment under the seat, to provide another 17 Ltr storage, or save 500 gm of weight.

Innovative Easy Fold for compact packing

For easy packing and minimal packed volume the harness was planned with the innovative and unique Easy Fold Feature. The clearly-folding section behind the protector takes on a hinge function and folds together for efficient packing and maximum compactness.

New EDELRID Triple-Lock-Buckles

The brand new Triple-Lock-Edelrid buckles are here used for a paraglider harness for the first time. They correct the shortcomings of standard Click-Lock buckles. Now, three conscious and sequential actions are required to open them. Spontaneous opening is not considered possible.

Available options to choose from

Hard Hybrid *

Soft Trim *

Soft *

Rescue Connection Line Kit
for other Spreaders *

The optional spreaders are a must for using a BIBPRO 3 with the BIBETA 6. An outstanding feature of all three spreader versions, Hard Hybrid, Soft Trim and Soft: cleanly running, covered reserve connection lines as a permanent part of the spreader. This saves not only a carabiner, but also the connection check before takeoff.

* The delivered Maillon-Carabiners are only allowed to be used for the Spreader-Harness-Connection

Cleanly running reserve connection

The one-piece Velcro-sleeved spreader-to-reserve connection lines run all the way to the reserve via the harness. They route through a retainer on the cover of the pilot's Maillon attachment, and continue directly to the shoulder straps, where they are stowed in a tube pocket, before connecting to the reserve.

SQR 220: available as an option

At 2.37 kg for a surface of 61.9 m² the new SQR 220 Companion reserve is the lightest tandem reserve, without being a lightweight. The Square Round series combines the advantages of round and cross canopies and demonstrates very fast opening, high pendulum stability and minimal weight.
